ABSTRACT: In the current study we add new records of 29 species of Caddisflies (Trichoptera) from eight different Brazilian states and report *Leptonema sancticaroli* Flint, McAlpine and Ross, 1987, *Flintiella pizotensis* Harris, Flint and Holzenthal, 2002, and *Oecetis connata* Flint, 1974 for the first time in Brazil.

Caddisflies (Trichoptera) include about 13,000 extant species described from all zoogeographic regions. The order is divided into 47 extant families and approximately 600 genera (Holzenthal *et al.* 2007; Morse 2009). There are about 2,200 species described from Neotropical region, which diversity and distribution of Trichoptera are still very incompletely known (Flint *et al.* 1999). A recent inventory of the Brazilian caddisflies fauna reported 378 species for the country (Paprocki *et al.* 2004). Currently, this number increased significantly to more than 420 described species, indicating that the diversity of the order in Brazil is underestimated. Besides that, many species are only known from their type-localities, resulting in fragmentary distributional records. Herein, we report *Leptonema sancticaroli* Flint, McAlpine and Ross, 1987, *Flintiella pizotensis* Harris, Flint and Holzenthal, 2002, and *Oecetis connata* Flint, 1974 for the first time in Brazil and add new records of 29 other species from eight different Brazilian states. The Instituto Brasileiro do Meio Ambiente e dos Recursos Renováveis (IBAMA) issued collecting permits (14591-2, 002/2004-MAB/FAUNA; 001/2005-MAB/FAUNA; 012/2006-MAB/FAUNA, 008/2007-MAB/FAUNA and authorization #19 of process #02005.001723/04-08). The specimens upon which this report is based are currently deposited at Coleção Entomológica Professor José Alfredo Pinheiro Dutra (DZRJ), Departamento de Zoologia, Universidade Federal do Rio de Janeiro, state of Rio de Janeiro, and Instituto Nacional de Pesquisas da Amazônia (INPA), state of Amazonas, both in Brazil.

Codes for Brazilian states are as follow: Amazonas (AM), Bahia (BA), Distrito Federal (DF), Espírito Santo (ES), Goiás (GO), Mato Grosso (MT), Mato Grosso do Sul (MS), Minas Gerais (MG), Pará (PA), Paraná (PR), Rio de Janeiro (RJ), Rondônia (RO), Santa Catarina (SC), and São Paulo (SP).

For each record the following data are registered: Brazilian state, municipality, locality, water body information, latitude, longitude and elevation above sea

level. The last three data were obtained with a Garmin eTrex® GPS.

For each species, in the distributional information, both new and known records are presented. The later is based on Flint *et al.* (1999), Paprocki *et al.* (2004) and Blahnik *et al.* (2004).

Distributional Notes

Phylloicus brevior Banks, 1915 and *P. fenestratus* Flint, 1974 were recorded from 'Altamira (03°39'00" S, 52°22'00" W), state of Paraná, southern Brazil', by Prather (2003) in her revision of the Neotropical genus *Phylloicus* Müller, 1880. Nevertheless, Altamira (03°39'00" S 52°22'00" W) is a municipality in state of Pará, northern Brazil. This misunderstanding was followed by Paprocki *et al.* (2004) in the Brazilian Trichoptera checklist. Likewise, *Blepharopus diaphanus* Kolenati, 1859 was recorded in Pará, Amazonas and Acre states, all in northern Brazil, by Flint (1978) and these records were not included in the previously mentioned inventory.
